

WEEKLY NEW BRUNSWICK INFLUENZA REPORT

Reporting period: March 1 to March 7 2015 (week 9)

Summary:

In New Brunswick, most influenza indicators decreased in week 9

New Brunswick:

- There have been 78 positive influenza detections during week 8, 11 A (H3) viruses, 43 A (unsubtyped) and 24 B.
- The ILI consultation rate was 24.6 consultations per 1,000 patients visits and was below the expected level for this time of year.
- One new influenza outbreak was reported (and 6 ongoing) in nursing homes.

Canada:

- All influenza indicators remained similar to, or declined, from the previous week. Elevated activity was mostly reported in the Central and Atlantic provinces. Influenza B detections continues to increase steadily, particularly in the West, the Prairies and in Québec. It is mainly affecting individuals less than 64 years of age. This increase in influenza B is expected as influenza B often shows up later in the influenza season.
- Influenza A (H3N2) continues to be the most common type of influenza affecting Canadians. Among laboratory detections, hospitalizations and deaths, the majority of cases have been among seniors 65 years of age and over.
- 1,081 laboratory detections of influenza were reported and the percentage of laboratory tests positive for influenza was 16.3% for week 9.
- The national ILI consultation rate was 50.5 consultations per 1,000 patients' visits, which is above expected levels for week 9.
- Thirty-three new influenza outbreaks were reported; 22 were in long-term care facilities, 6 in hospitals and 5 in other settings. An additional 5 outbreaks of ILI were reported in schools. There has been a higher number of reported influenza outbreaks to date this season compared to the same period in previous seasons.
- Antigenic characterization: NML has antigenically characterized 149 H3N2 viruses, 143 of which showed suboptimal match to the vaccine strain, 3 A (H1N1)pdm09 that were a match to the vaccine strain and 153 B viruses, 146 of which were a match to the vaccine strain.

International:

- Globally, influenza activity remained high in the northern hemisphere with influenza A (H3N2)viruses predominating. Some countries in Africa, Asia, and the southern part of Europe reported an increase in influenza A (H1N1)pdm09 activity.
- Human infection with Avian Influenza: As of March 13 2015, a total of 631 laboratory-confirmed cases of human infection with an avian influenza A (H7N9) virus were reported in China (as well as in Taiwan, Hong Kong and Malaysia) including 221 deaths. The majority of cases have presented with severe acute illness, rapidly progressing to severe pneumonia. Most human cases have reported a history of exposure to poultry or live bird markets. There is currently no evidence of sustained human-to-human transmission of H7N9.
- Other Respiratory Viruses:
 - MERS-CoV: From April 2012 to March 13 2015, 1,060 laboratory-confirmed cases of MERS-CoV have been reported from 23 countries. All cases have either occurred in the Middle East or have a direct link to a primary case infected in the Middle East. Among the 1,060 cases, 394 were fatal. Investigations to identify the source of infection and routes of exposure are still ongoing. The increase in cases since December 2014 warrants close monitoring considering the surge in cases that was seen in the spring of 2014.

1) Influenza Laboratory Data¹

- Most influenza indicators decreased.
- 78 influenza detections were reported during the reporting period; 11 A (H3) viruses, 43 A (unsubtyped) and 24 B.
- Since the beginning of the season, 903 positive influenza detections were reported, 240 were A (H3), 560 were A (unsubtyped) and 103 were B viruses.

¹ Surveillance specimens are submitted by recruited New Brunswick Sentinel Practitioner Influenza Network (NB SPIN)practitioners, which are comprised of 8 sites in Emergency Rooms, 2 sites in Family Practice, 2 sites in First Nations communities, 1 site in a Nursing Home, 2 sites in Universities and 8 sites in Community Health Centers. Diagnostic specimens are submitted by physicians in the community/hospital setting. Influenza laboratory data is comprised of results from surveillance and diagnostic specimens. All laboratory specimens are tested using a real-time PCR assay, which is a rapid detection method designed for detection of all known variants of influenza A and B. All laboratory-confirmed cases are reported for the week when laboratory confirmation was received.

Graph 1: Number and percent of positive influenza specimens in New Brunswick by week, up to March 7 2015 (data source: G. Dumont Lab results)

Note: Most of the Influenza A untyped specimens are of the predominant strain.

Table 1: Positive influenza test results by Health Region, in New Brunswick for reporting week, cumulative current and previous seasons.

2) ILI Consultation Rates³

- During week 9, the ILI consultation rate was 24.6 consultations per 1,000 patient visits which was below the expected levels for this time of year.
- During week 9, the sentinel response rate was 20%, for both the FluWatch sentinel physicians and the NB SPIN practitioners.

Graph 2: ILI Consultation Rates in New Brunswick, by report week, season 2014/15 compared to previous seasons*

* The mean rate was based on data from the 1996/97 to 2013/2014 seasons and excludes the Pandemic season (2009-2010).

3) ILI and Laboratory-Confirmed Outbreak Data

Table 2: ILI activity/outbreaks in New Brunswick nursing homes and schools for the reporting week, current and previous seasons.

	Reporting period: March/01/2015–March/07/2015			Cumulative # of outbreaks season 2014-2015	Cumulative # of outbreaks season 2013-2014
	Lab-confirmed outbreaks in Nursing homes	ILI school outbreaks	Lab-confirmed outbreaks in Other settings		
Region 1	1 out of 13	0 out of 74	0	8	3
Region 2	0 out of 15	0 out of 81	0	8	2
Region 3	0 out of 14	0 out of 95	0	8	4
Region 4	0 out of 6	0 out of 22	0	6	1
Region 5	0 out of 2	0 out of 18	0	4	0
Region 6	0 out of 9	0 out of 35	0	5	3
Region 7	0 out of 4	0 out of 27	0	8	2
Total NB	1 out of 63	0 out of 352	0	47	15

*Two or more ILI cases within a seven day period, including at least one laboratory-confirmed case of influenza. Outbreaks are reported in the week when laboratory confirmation is received.

**Schools reporting greater than 10% absenteeism which is likely due to ILI.

³ A total of 31 practitioner sites (18 FluWatch sentinel physicians and 13 NB SPIN sites) are recruited this season to report the number of ILI patients and total patient consultations one day during a reporting week.

Graph 3: Number of Influenza Outbreaks (nursing homes, hospitals, other)⁴ and ILI Outbreaks (schools)⁵ reported to Public Health in New Brunswick, by report week, season 2014/15.

4) Influenza associated Hospitalization⁴ and Death⁵ Surveillance⁶

Graph 4: Influenza associated Hospitalizations and ICU admissions in New Brunswick, by week of hospitalization for current and past season.*

*Those who had been hospitalized 15 days or more prior to laboratory confirmation date were excluded from the graph

** Seventeen deaths have been reported so far in season 2014-2015.

⁴ Hospitalizations (including ICU admissions) are influenza associated; they may or may not be due to influenza.

⁵ Deaths are influenza associated; influenza may not be the direct cause of death.

⁶ In early January 2014, the Office of the Chief Medical Officer of Health implemented a new provincial surveillance system in collaboration with the Regional Health Authorities to monitor influenza-associated hospitalizations, intensive care unit admissions and deaths.
